NIMH-FMRIF FMRIF

Migration

From: Jimmy Frasche
Date: Mon, 16 Sep 2019 at 6:40pm

I am prepared to run a migration of all the presentations. There are a few options that I should run by you before I begin.

The first is to have the migration pull all the videos and slides and subtitles off your server. It's only ~460 files but a good portion of these are ~1hr videos and I don't want to DoS you. If your server can handle it and I can start running that as soon as you say, but you might want to add our server's IP, 72.51.43.139, to your firewall if you have anything that would shut down the connection for using too many resources.

I could also provide you a list of the necessary files that you could put in a zip on some publicly accessible endpoint I can wget onto the server. I've attached a spreadsheet of the data for this stage in this migration, for reference (note that there are four cells left intentionally blank because it will be easier to handle those after the automated migration runs). I can pull out just the files if you want to go with this option.

Other than that, the only other publicly available pages I could find are

- the home page
- https://fmrif.nimh.nih.gov/public/about
- https://fmrif.nimh.nih.gov/public/directions
- https://fmrif.nimh.nih.gov/public/research/PInvestigators.html
- https://fmrif.nimh.nih.gov/7t-images (and the pages for the images listed therein)

If there are any other public pages to be moved over, I will need a list of those urls.

Any changes made to the site after the migrations are run will have to be applied to both sites to keep them in sync, but based on what I've seen this will just be a handful of summer 2019 presentations at most so it should be straightforward.

Also, this one. We have another FIM project (maybe more) coming up in October sometime. So, in terms of timing, we would really like to make more headway on this existing project.

Thanks!

Roark Maccado Thu, 21 Nov 2019 at 11:44am

Hi Jimmy,

I work on setting up your access to our server/s from IP (72.51.43.139). If you want to send me RSA keys and a username, i can get your local account set up on our end.
I'm going to see if i could put them on our BOX external sharing app.
You'll have to register with a user account to be able to "collaborate" within my shared directory.
I wanted to also make sure that I will be able to have a way of adding new links for future content, as well as making sure all static content such as pdf's and videos stay on our webservers attached RDM storage.
Lastly, I've attached a .zip file of a github repo code base for this portion of our site.
Happy to help connect the dots

Jimmy Frasche Fri, 22 Nov 2019 at 7:12pm

I've attached the public key for the devel user on our server (72.51.43.139)

I'm a bit confused about the plan with the box account.

If I have ssh access I can do a server-to-server scp.

If there's a password protected sharing site, I'd probably need to download them locally then upload them to the server and it's going to a while roundtripping through a residential connection.

All the requested files are public. I could just download them from the site where they are now. The only concerns with that are (a) getting banned midway for using too much bandwidth or (b) causing too much load and degrading your site's response time.

> > I wanted to also make sure that I will be able to have a way of adding new links for future content, as well as making sure all static content such as pdf's and videos stay on our webservers attached RDM storage.

The drupal site will store all files uploaded into in a movable (with some configuration changes) directory. You will be able to add documents and videos through its interface.

I went through the code. The templates are in Go's syntax but the live site is saying that gunicorn served the request. Is it running an older version that's still using the flask code?

I also see a survey that is news to me. Is this being used?

Hi Jimmy,
Transferring of files:
I doubt external non-nih ssh access to this machine will even be granted on this machine. I'm foolish for even considering it. I'm already fighting our security folks regarding updating our firewall waivers.
You're right, the sharing site (box) would be a round about way of doing things.
We could try having me ftp/rsync the data to your server? Could you possibly get me an account there? I could have success uploading files (ftp/ssh via rsync) to a destination from another internal valn over here.
I've attached my public key for maccadorc user.
Worst case, i'll just fedex you an external HD and just be done with it...lol
Data Storage:
Sounds good, I just want to be able know how to modify the site in order to accommodate for any file level storage expansion needs in the future.
CODE:
So, i've got some splainin' to do...
...our original creator of the site created the site using the go syntax and had the survey working with it. After he left, we had a need to add additional miscellaneous recorded lectures (MISC section that serves the MVPA courses), and found that the go code was a bit hard coded for our main lectures.
Our prior developer took this on and got it patched together with a limited amount of time using flask. Unfortunately, he left before integrating the survey back into the course lectures.
Sorry for the confusion Jimmy, thought I'd sent it all and explain as we go along.

If you create a tarball containing all of the relevant files and put it somewhere apache serves like /COURSE/files.tar I can download it directly to the server with ratelimiting. I can leave it going over night and, once I have it, you can delete it.

It would suffice to run
`tar -cf files.tar fmrif_course mvpa_course`
in the COURSE directory.

If you run `md5sum files.tar` after creating files.tar and post the result I can use that to verify that everything downloaded correctly on my end.

I would also recommend deleting the compiled go server and its backup from that directory since the binary contains your recaptcha secret key and is publicly available on: https://fmrif.nimh.nih.gov/COURSE/

post-holidays, pre-more-holidays ping

Bob Morse Tue, 14 Jan 2020 at 3:38pm

Any hope on making progress on this in the new year?

Vinai Roopchansingh Thu, 16 Jan 2020 at 2:53pm

Not sure what's the hold-up with this aspect of the site migration. But pinging here to make sure we keep things going.

Bob Morse Thu, 16 Jan 2020 at 2:56pm

We never got a reply to Jimmy's post on November 25. We're not sure why.

Roark Maccado Thu, 16 Jan 2020 at 3:03pm via email

Sorry Bob, that's my fault. I'll get on it and let Jimmy know when the tat ball is ready.

Roark Maccado Thu, 16 Jan 2020 at 8:50pm

Hey Jimmy,

Sorry about the delay, file should be about 200G named morse_files.tar and MD5SUM is as follows:
f40e658d2e467a7f5345dfaed0e1bca8
Download away try to limit rate and time to around now 8:PM - 8:AM (2000 - 0800) EST please.
Let me know if you run into any issues.

Jimmy Frasche Fri, 17 Jan 2020 at 2:22pm

Sorry for the late reply, dealing with the aftermath of having no electricity this morning (I can finally have coffee!)

Is that `tar -cf files.tar fmrif_course mvpa_course`? It's an order of magnitude larger than I'd expect. Rate limiting to 1Mbs would take the whole weekend. Did it pull in version control hidden folders?

If there's just more and larger files in there than I was expecting can you make a tar of just the mp4 files? All browsers support that container now and the pdf and subtitle files are tiny in comparison so grabbing those one at a time over sequential http connections shouldn't cause any issues

---

Jimmy Frasche Tue, 21 Jan 2020 at 6:12pm

Bumping for previous message.

Roark Maccado Tue, 21 Jan 2020 at 6:46pm via email

Let u know when the mp4 tarball is ready.

Roark Maccado Wed, 22 Jan 2020 at 2:32am

Should be ready now:
eee5ca6bd903e191ca21fe65182b2a27 mp4archive.tar.gz

Jimmy Frasche Wed, 22 Jan 2020 at 1:48pm

Downloading at 1mbs. If that's too much I can stop it and restart with a slower speed

---

Jimmy Frasche Mon, 27 Jan 2020 at 1:25pm

Sorry for the inconvenience.

After it finished downloading we ran into issues caused by low disk space. We had to delete it and its local backups while we cleared more room.

All good to go now and have restarted the download.

Jimmy Frasche Thu, 30 Jan 2020 at 1:39pm

downloaded and the hashes match
